

Type on laptop with phone

Continue

How to type from mobile to laptop. How to type# on a laptop.

Dealing with long sessions using an Android device's tiny touchpad can be tiring and has been a major barrier for those who haven't used desktops and laptops as productivity devices. But what if you could have the best of both worlds and use your computer's keyboard on your Android phone or tablet? In this article, we'll look at exactly what and how to do it. Read: Best Android Text Editor for Programming 1. Use Android Computer Keyboard via Bluetooth If you have a Bluetooth enabled keyboard it should be easy to use. We recommend the Logitech K40 for \$ 25 as it is compatible with both Android and iOS. First, turn on the Bluetooth keyboard. Then open the Bluetooth settings in the Settings app on your Android device and you should see your Bluetooth keyboard there. Just click on the name of the keyboard, wait for it to connect, and you're done. Typing wirelessly on a phone or tablet keyboard isn't much more convenient, and while the range and speed depend on the Bluetooth technology used by the keyboard or device, the delay should be minimal. Pros: Fast, hassle-free connection No additional software required Completely wireless Cons: Does not work with non-Bluetooth keyboards Conclusion: Typing with Bluetooth keyboards on Android works flawlessly with very little setup or connection time. If you have a Bluetooth keyboard or are looking for trouble-free operation, choose a Bluetooth keyboard and the best part: no wires attached. 2. Use the Android PC keyboard via USB OTG. What if you don't have a Bluetooth keyboard at hand and don't want to buy an expensive new keyboard? This method will work with any regular keyboard as long as it's connected to your computer via USB, but you'll need an OTG or On-The-Go cable. Connect the OTG cable to your smartphone or tablet and connect the other endWorking for long sessions using the tiny touchpad on an Android device can be tiring and is the main reason why PCs and laptops have not become productivity devices. But what if you could take the best of both worlds and use a computer keyboard on your Android phone or tablet? In this article, we'll look at exactly that and how to do it. Read: Best Android Text Editor for Programming 1. Use Android PC Keyboard via Bluetooth. If you have a Bluetooth-enabled keyboard, then it's easy. We recommend the \$25 Logitech K40 as it is compatible with both Android and iOS. First, turn on your Bluetooth keyboard. Next, open the Bluetooth settings in the Settings app on your Android device and you should see a Bluetooth keyboard there. Just click on the name of the keyboard, wait for it to connect and you're done. Typing wirelessly with a phone or tablet keyboard couldn't be more convenient, and while the range and speed will vary depending on the Bluetooth technology used by the keyboard or device, latency should be kept to a minimum. Pros: Fast hassle-free connection No additional software required Fully wireless Cons: Won't work with other non-Bluetooth keyboards Verdict: Android Bluetooth keyboard typing works flawlessly with very fast setup or connection times. If you have a Bluetooth keyboard or are looking for a hassle-free experience, be sure to choose a Bluetooth keyboard and the best part: there are no filaments (wires) connected to it. 2. Use Android PC keyboard via USB OTG. What to do if you do not have a Bluetooth keyboard at hand, but do not want to buy a new expensive keyboard? This method works with any regular keyboard as long as it's connected to your computer via USB, but it requires an OTG or On-The-Go cable. Connect the OTG cable to your smartphone or tablet and connect the other endand you are done! It even works with wireless keyboards connected via a USB receiver, but be prepared that there is always a broken OTG cable connected to the phone. Although the process is not as convenient as wireless Bluetooth, using a wired connection will give you a great lag-free typing experience. Pros: Works with almost all keyboards No lag Cons: Requires an additional OTG cable Wired connection Verdict: If you're looking for smooth typing with your current keyboard and don't need to spend too much money, a cheap OTG cable is just what you need, it can offer what you're looking for. 3. Use Android PC keyboard via Chrome extension. If hardware isn't for you, there's always the power of software. Clipbrd is a Chrome extension that uses the Internet to sync via Universal Clipboard, providing an overall seamless workflow between your phone and computer. Read: Best Clipboard Manager for Windows To use Clipbrd, you need to install the Chrome extension on your PC/Mac and download the free app to your phone from the Play Store. Just set your email ID and forget about it! Clipbrd runs in the background and anything you copy on any device is also available on any other device running Clipbrd. And if privacy is a concern, Clipbrd uses AES-256 to encrypt all your clipboards. The main mantra of this extension or app is that you can work on your computer without worrying about your work not being on your phone, not to mention the convenience of phone-to-PC links or back-up. Another such extension: Snapcopy Quick tip: You can even work with Google Docs or Google Keep on your computer and sync them across all your devices via the respective apps or any browser (this works on iOS too). Advantages: Wireless Ideal for moving text files between your phone/tablet and computer. Works with Windows/Mac/Linux and laptops.Cons: Limited to Chrome. The extension/app must always be running. Verdict: While this may seem a bit unusual, if you have a MacBook or laptop and love typing, this may be the best free alternative for you. Also, you can't argue with how it connects your phone and computer together, which is an added bonus. 4. Use Android's PC Keyboard Through Apps Speaking of software, there are standalone apps that are far more powerful than extensions that let you type and even control Android from your PC. Here are some of the apps we recommend for this. 4.1 DeskDock Pro DeskDock has been around for a while and was one of the first Android apps to let you use your computer's keyboard on your phone or tablet. The app has a lengthy setup process, so buckle up. While there is a free demo of the app on the Play Store, you cannot use the keyboard directly on your phone. So you have to spend around \$6 to get the app on your phone. We have written a detailed article on how to use DeskDock to share your computer mouse and keyboard, but in short, you need to install the app on your Android device and the server program on your computer (Mac/Windows/Linux) and you also need to connect your device to your computer via using a USB cable. Yes, the price may be a bit steep and the setup process is simple, but the amount DeskDock brings to the table makes it all worth it. DeskDock essentially turns your Android device into another screen/display next to your computer that can be controlled with both keyboard and mouse. DeskDock is the best app on this list, from the universal clipboard and drag and drop to the ability to connect more than one phone/tablet. You know what's cooler? Customizable keyboard shortcuts to control your phone. DeskDock has it too. Pro: Control your phone with keyboard and mouse. Shared storage. Multiple phone supportCustomizable keyboard shortcuts Cons: Tedious setup Expensive wired connection Read: Best GIF Keyboard Apps for Android 4.2 Remote Keyboard If you don't like DeskDock's features and price, Remote Keyboard is a great alternative and it's completely

free. Like the previous app, Remote Keyboard comes with an Android app, but you also need to install a telnet client on your computer and setting it up is just as tedious. But the great thing about the remote keyboard is that it supports wireless networks along with USB and ADB. As a telnet client, you can use the built-in Windows telnet client or a third-party client such as PuTTY. We recommend PuTTY and show you how to set it up with a remote keyboard. After installing the Remote Keyboard app and granting permission, the port number and IP address should appear on the phone screen. Open PuTTY and enter the IP address and port number and you should be connected. While Remote Keyboard isn't as feature-rich as DeskDock, it's a free app that does the job pretty well. Pros: Supports WiFi connection Universal box Totally free Cons: Computer must be on Long setup process 4.3 Bonus app: Samsung SideSync If you own a Samsung smartphone or tablet, you're in luck because Samsung already has this free app you can use can control Samsung devices from your computer. Available for both Windows and Mac, Samsung Sidesync is the only app you need. You don't need to install anything on your phone. Sidesync supports both wireless (over the same network) and USB connections and is surprisingly easy to use; Just open Sidesync on your computer and connect your phone, that's it! It offers seamless connectivity with transferring files, images and texts with a simple drag-and-drop, and you can even take phone calls on your computer if needed.Conclusion: This option is intended for people who prefer to work on the computer as a whole and can do it by controlling the phone with the same keyboard. 4.4 Keyboard Apps Finally, we have some full-sized keyboard apps in the Google Play Store that can replicate your computer's keyboard and share its functionality from the phone itself. Some we can recommend are the hacker keyboard and the developer keyboard, both of which have a full-sized keyboard layout with arrows, function keys, and a number pad. But these are on-screen keyboards, and sitting with them for long periods of time is definitely not fun, so we don't recommend using them over a physical keyboard. However, if you're using your phone for SSH or even light coding, it's good to know that you can use them instead of a real keyboard, since most other Android keyboard apps don't have Esc, Ctrl, or Function keys. Pros: Full keyboard in the phone itself Cons: Impossible for productivity Verdict: You never know when you'll find yourself in that desperate situation where you need a functional key on your phone/tablet, so play it safe rather than Excuse Me. If you don't mind typing on the screen and are used to the computer keyboard layout, these apps offer exactly the same with punctuation marks where you'd expect them; all this just as an app on your phone. Summary: Use the Android PC Keyboard If you want to work on your phone from a computer, Chrome extensions or stand-alone apps will do the job, while the latter will give you more customization and control over your phone. And if you don't have a keyboard with you (perhaps in an emergency) but need one on your phone/tablet, check out the full-size keyboard apps on the Play Store. So there were five of ususe Mac / PC keyboard on your Android device and maximize your productive time. what do you use Did we miss something? Let us know in the comments below.
